February — March "GARDEN GOSSIP"

Telephone SAN MATEO DIAMOND 3-2286

NOVELTIES

If we are blessed with the weather we expect in this section during February and March there is lots of work and fun in the garden. Many years ago the All American trials for seeds was instituted and for 1950 a gold medal was awarded to a Petunia called Fire Chief. It is the first time in eleven years that the judges felt a flower justified a gold medal award and this petunia is really different. It is a regular dwarf petunia for garden work but it is actually a scarlet red — very bright and very striking. Sew in a flat or flower pot until the end of March or directly outdoors thereafter. Be sure to send or call for a packet of Fire Chief and have something worthwhile and different.

Two vegetables received Gold medal awards. Squash Uconn is a bush form of the popular Table Queen or Danish squash, so favored for baking. It makes a fine thrifty plant for the home garden. Bean Top Crop is a very yielding Bush Bean. Sow both the new Squash and bean end of March and at intervals until July for a steady supply of fresh vegetables.

BEGONIAS

Again we have received our 1950 seed of tuberous begonia from Blackmore and Langdon, England. We have some glowing reports from some amateurs on their success. One Burlingame lady reports over two hundred and fifty begonias last year from a dollar packet and has color pictures to support her statement! Why not try raising tuberous Begonias from seed using Vermiculite as the planting medium? Here's how. Put about an inch of broken pot in the bottom of a five inch pot, fill the pot with Vermiculite, place pot in a bucket of water into which has been added one tablespoon of Liquinox. The table should be up to one inch from the top of the pot and no more than one tablespoon of Liquinox per gallon. The Vermiculite will have soaked up the water in five minutes. Vermiculite is neutral, free from disease and insects and is an excellent medium for both seeds and cuttings but has no food value. Place the pot in the kitchen or near the hot water heater. The night temperature should not fall below 40°. Repeat the same soaking and feeding about once per week. At the end of four weeks the seedlings can be pricked out into a mixture of lead mold, sand and soil. What fun!

We also have the very finest Antonelli Begonia bulbs and the price is most reasonable. Remember to start your begonia bulbs in damp peat moss when the little pins of growth start. Of course they must not be put directly outdoors until about the middle of April.

Our Calla lilies are all very choice bulbs. Again we can recommend the baby Calla. It makes a dainty plant with a very attractive blossom. The Pink and the Yellow are splendid subjects and quite uncommon. Remember to cushion and cover the bulbs with sand in heavy soils.

Why not try some Caladiums. They require similar treatment to Begonia bulbs with the difference that they have to be planted in a good soil mixture right to start with. A few of these mixed in the begonia bed are really different.

HALF HARDY VEGETABLES

During February and March is the proper time to sow Tomato, Pepper and Egg Plant. A five inch pot of each item will provide ample plants for the average family. Use a loose porous soil in order to avoid root injury when transplanting. One part sand two parts peat moss or leaf mold and one part soil is a good mixture. Start the plants in the garage or kitchen and do not expose them to frost until after March 31st. Our killing frosts are usually over by this time. The best varieties to plant are listed in the "Gossip."

PERENNIAL VEGETABLES

Nothing tastes better than vegetables fresh from the garden and surely nothing is easier to grow than Asparagus, Artichokes and Rhubarb. Those of you who have established plants of Artichokes remember that it is essential to dust monthly from February on with our Niagara 6% Chlordane dust. This controls the ants and as they are responsible for most of the aphis trouble it means clean Artichokes. Those of you planting new artichokes or rhubarb remember to dig a hole about 18 inches in diameter and 18 inches deep. Into this hole put one part of the soil mentioned in the previous paragraph plus one half well rotted manure. Put the plants right in the middle of this good mixture and they will get off to a grand start.

PEACH LEAF CURL

Let us spray

If you have copper on your trees at the time the leaf buds open you will not have peach leaf curl. When do the leaf buds open? That depends on the weather. If it rains after you spray it is necessary to spray again. We like to see the trees look blue just like the farmer does. Then we know we have protection. The general winter spray recommended in our November-December guide contains C. O. C. S. Copper and it would be a good job to spray all fruit trees, roses and shrubs which cast their foliage before the leaf buds open. We repeat the formula:

To each gallon of water add:

- 4 Tablespoons C.O.C.S. Copper
- 5 Tablespoons Volck Oil
- 3 Teaspoons Black Leaf "40"
- 2 Tablespoons Niagara 50% D.D.T.

Remember the above must not be used at the strength detailed after the foliage appears. Also remember be sure to spray.

SOIL FUMIGATION

We are still very much sold on soil fumigation for built up areas and Shell DD is the most satisfactory method found to date. When putting in new plants, lawns or new areas it will be found to take care of most of the insects. It is quite easy to apply. We will be glad to explain this to anyone interested. For those of you with larger areas requiring treatment we suggest you contact the Bay Pest Control Company, 1217 South Railroad Ave., San Mateo, Telephone Diamond 3-9286. They are equipped to do the work for you economically and efficiently.

All the vegetable and flower seed detailed on this list are to be planted during February and March. In fact this is the last call on some of the flowers such as Sweet Peas, Larkspur, Clarkia, etc. Get busy now in order to get maximum performance and incidentally save on your water bill. And plant something different. We even have strawberry seed which if treated in the same way as tomato seed will produce fruits the first season. Are you remembering we are going to have daylight saving this summer starting Sunday, April 30th. Better health and more flowers and vegetables can easily result from the extra time. We are here to advise you on your garden problems. We do not have all the answers but we can help you as much with your garden as your doctor can with your health.
